

Cybersecurity

Exploitation evidence, not disclosure volume

381

Actively exploited CVEs attributed to the single largest vendor in the catalogue [T1]

104

Of that vendor's exploited flaws tied to known ransomware campaigns [T1]

11

Vendors carrying 25 or more separately catalogued exploited flaws [T1]

Decision summary

Most security buyers are drowning in disclosed vulnerabilities and cannot defend a priority order. The public record already contains the field that fixes this. CISA catalogues only vulnerabilities with confirmed active exploitation, and flags which of those are used in known ransomware campaigns.

The opportunity is not to collect more documents. It is to connect funding, technical proof, regulation, competitors and buyers into one account-level decision map.

The practical question

Which accounts carry catalogued exploited exposure and a visible budget to act on it?

What Tensorust would monitor

- Resolve catalogued exploited flaws to the vendors and components present in a target's environment.
- Join federal and agency award records so exposure evidence carries a named buying entity and a budget line.
- Monitor catalogue additions and agency directives so outreach is triggered by a dated public event.
- Score accounts by exploited exposure, reporting obligation, budget visibility and source confidence.

Prepared as a no-cost industry sample. Nothing in this brief is a substitute for engineering, legal, regulatory, procurement or financial review.

Evidence map

Four public signals that can be converted into a commercial account list

Signal	Commercial meaning	Source
Exploitation is a far smaller set than disclosure	CISA catalogues only vulnerabilities with confirmed active exploitation. That single field turns an unusable disclosure feed into a defensible priority list.	[S1]
Ransomware attribution is already public	The catalogue flags which exploited entries are known to be used in ransomware campaigns. That distinction is available to anyone and is rarely used in positioning.	[S1]
Vendor concentration is measurable, not anecdotal	Exploited-CVE counts concentrate in a small number of widely deployed vendors. This is a count of catalogued flaws, not a judgement that a vendor is least secure.	[T1]
Federal buying leaves an inspectable trail	Award records, agency spend and vendor registrations are public, so displacement opportunities can be evidenced against the record rather than inferred.	[S2]

A 30-day operating test

1. Define	Choose one product, geography and buying event. Exclude broad market questions.
2. Resolve	Join the owners, agencies, awards, filings, research and named competitors connected to that event.
3. Score	Rank accounts by available budget, timing, technical fit, incumbent weakness and source confidence.
4. Monitor	Refresh the evidence weekly and alert only when a score-changing event occurs.

Why this is different from a search result

Each source record in Tensorust keeps its origin URL, retrieval timestamp, rights note and payload hash. The useful output is not a stack of links. It is a repeatable decision recipe whose evidence can be inspected and refreshed.

A full engagement would add company and facility resolution, contract and filing joins, confidence thresholds, exclusion rules and a change-monitoring cadence.

Sources, provenance and limits

Primary public sources

[S1] CISA Known Exploited Vulnerabilities Catalog (public domain)

<https://www.cisa.gov/known-exploited-vulnerabilities-catalog>

[S2] USAspending.gov federal award data (public domain)

Tensorust governed-data screen

- Tensorust governed CISA KEV lane: exploited-CVE counts resolved per vendor, ransomware attribution retained.
- Every retained record includes its source URL, retrieval metadata and governed row ID

Method and limitations

- Counts are distinct catalogued exploited CVEs per vendor. A high count reflects software ubiquity and attacker focus, not that a vendor is least secure.
- Company statements are treated as company claims unless independently corroborated.
- Keyword screening can include false positives and miss relevant records. A paid decision map applies entity resolution and manual quality gates.
- No claim is made that any reader needs Tensorust, lacks internal capability, or has not already identified these signals.

Compete above your headcount.

Tensorust turns public records into cited competitive intelligence for teams taking on larger incumbents.
